## BIRDS

### OviGrit 1 Birds

**Easily absorbable grit, containing the most essential naturally available trace elements and minerals.** ZIt ensures healthy growth and correct formation of the skeletal system, especially in young birds. Regular dosage of OviGrit provides essential nutrients for the formation of strong and healthy eggshells. It also provides the body with calcium and magnesium throughout the season. Ensures the correct functioning of the nervous and muscular systems, supports the formation of new feathers, and improves immunity. OviGrit has a pleasant smell of natural vanilla.

**Dosage:** OviGrit Birds 1 should be available for the birds to consume without limit throughout the year. It should be administered in separate bowls going with the rule "less but more often" to avoid feed pollution and dust settling.

### OviBad Essence Birds

**OviBad Essence is an essential addition to birds baths.** It softens the water, thus making feathers silky soft, shiny and flexible after bathing. Bathing with the use of OviBad makes moulting easier for birds: it removes dust, dandruff and callous skin. It loosens old feathers, thus making their shedding easier. Crystals of essential oils contained in OviBad, soluble in water, have a soothing influence on open pores of the skin – they also show antibacterial action on the skin (effectively fight feather pests). Essential oils remain on the bird skin and gradually evaporate, thus reaching the respiratory tract. Additionally they ensure the effect of inhalation, improving the respiratory function.

**Dosage:** 2 ml (2 pipettes) / 100 ml of water. **Shake well before use!!!**

# Mauser Birds

The preparation supports the formation of healthy and strong plumage, ensuring its high flexibility. Methionine included in the preparation is an essential amino acid containing sulphur. This component is beneficial to the proper functioning of the liver and it is included in the proteins that build up feathers. Choline contained in the preparation is particularly necessary during the period of intense exercises and during the plumage changing period. Vitamin B4 (choline) is essential for the transport and metabolism of fats.

**Dosage:** 1 ml (10 drops) / 100 ml water or 100 g feed  
- moulting period: 3-4 times a week.

## VitaMixer Multi Birds

Excellent combination of the most important vitamins, minerals and amino acids. Prevents the results of micronutrient deficiency in periods of increased demand: pairing, breeding, separation of young birds from mothers, intense growth and development, stressful situations, moulting, and recovery from illnesses and after vaccinations.

**Dosage:** 0,5 ml (5 drops) / 100 ml water, 2-3 x week

## VitaMixer E+Se Birds

Vitamin E is necessary for the maintenance of high fertility and physiological performance of muscles and blood vessels. Selenium in combination with vitamin E contributes to proper development and muscle growth. VitaMixer E+Se should be administered in the breeding period, before pairing and in cases of vitamin E and selenium deficiency.

**Dosage:** 0,5 ml (5 drops) / 100 ml of water - once a day  
- pairing - 3 times a week, 30 days before pairing day
